Dear colleagues,

Sorry for the long email, but please read it, as it has important information.

For those who may not know, I inherited the VR codebase from MeetKai about three weeks ago, as they transition to other projects. Since then, I have been: 1) studying the codebase, 2) moving deployment to platforms whose accounts are under our control, and 3) fixing several issues present in the latest version of the app.

I'm happy to share that we are very close to having a version 1.0 of the app that checks all the boxes we promised BWC. At this stage, **I need your help thoroughly testing the app one last time.**

I've included a longer changelog below, but in short, I fixed several UI issues, including non-functional menu items; authentication issues, such as email/password login not working for returning users; added analytics so we can track who is accessing the website and for how long; and improved the AI tool with a better model, clearer instructions, and more professional chatbot behavior. Regarding the latter, the app now also takes a screenshot of the environment and attaches it to the AI model request, which has significantly improved the quality and usefulness of the responses.

The most concerning recurring issue I found was incorrect text throughout the app, such as tooltips in mill-related modules referencing CNC machines, typos, and other inconsistencies. I have fixed many of these, but this is where careful testing will be especially important.

What I need from you is about two to three hours of meticulous testing of the new app. It doesn't have to be completed in one sitting. You can access the latest version at <http://sightvr.org/> (please note the new domain). For reference, this is the latest version by MeetKai: <https://mou-virtual-demo.mkms.io/>

In particular, please read every piece of text, including tooltips marked with the circled "i"; complete every module carefully; complete every assessment; review the dashboard; try the new AI tool multiple times; and test signing in and signing out.

Whenever you find an issue, including grammar issues, please let me know by using this format: "I saw [current issue], but it should be [suggested correction]."

@Fadel: Everything has been thoroughly documented on GitHub, including the platforms and accounts we use. Can you please check the cost of the latest GPT queries? They are likely more expensive now, as the app is sending images to be analyzed. I am using GPT 5.4 Nano, but the Mini model is significantly better at processing images.

Here is the changelog (major changes only):

1. Dashboard / UI

- Removed unused dashboard items: Settings, Feedback, sidebar username, profile image, and My Account image.
- Added an About sidebar item/page with project, grant, and contact information (**Fadel: What do you think of this text?**).
- Removed My Account Security section and Change password button.
- Renamed chat header from Miami University Bot to SIGHT bot.
- Renamed machine-card buttons from Take assessment to Assessment.
- Cleaned up many module end-screen messages so text order matches button order: Go Back, Restart, Next / Exit.
- Fixed Milling/Cobot/CNC wording, typos, and PPE tooltip text.

2. Authentication / Profile

- Reworked auth flow to explicit choices: Continue with Google, Sign in with email, and New to the platform? Join now.
 - Sign-up now collects full name, email, and password.
 - Firebase uid, email, and display name are carried into Unity profile state.
 - My Account now shows real Firebase/profile data instead of placeholder values like New User.
 - Sign-out now performs a cleaner app reset/reload and avoids stale state between users.
 - Forgot-password flow now shows Firebase-specific errors instead of a generic failure.
- 3. Database / Backend**
- Added/updated Cloudflare Worker backend under Database/Server.
 - Worker now uses Firebase UID as PLAYER.player_id.
 - Worker upserts PLAYER with name/email into Google Cloud SQL / MySQL.
 - Unity PlayerDataService was updated to use the new Worker URL.
 - Added database documentation, ERD, MODULE / MACHINE values, and Database/Inserts.SQL.
- 4. AI Chatbot**
- Added waiting dots while the AI response is pending.
 - Added manual speaker button near the mic button.
 - Changed Deepgram TTS from automatic playback to user-triggered playback.
 - Added screenshot capture before sending AI questions.
 - Added /query_with_screenshot API endpoint.
 - Added conversation ID reuse.
 - Enabled limited Unity rich text formatting in chat.
 - Redeployed Cloud Run with MODEL=gpt-5.4-nano.
 - Updated SIGHT Bot system instructions for safety, machine recognition, screenshot context, and supported machines.
 - Streaming was attempted, then abandoned; the final flow uses full-response requests with the improved UX.
- 5. WebGL / Deployment**
- Added and refined local WebGL server script for correct MIME types and local testing.
 - Fixed local .wasm / .data loading paths.
 - Adjusted Firebase script loading in WebGL templates/build output.
 - Fixed WebGL template settings so future builds use the project template.
 - Added monotonic loading bar behavior so deployed progress does not move backward.
 - Added Google Analytics tag.
 - Fixed GitHub Actions / Cloudflare deployment workflow:
 - sparse checkout path issues
 - R2 asset URL rewriting
 - branch-specific prs / ... asset URLs
 - cache-busting and revalidation behavior
- 6. Documentation**
- Improved main README.MD sections for build, Firebase auth, Cloudflare deployment, GitHub Actions, Google Analytics, Cloud SQL, AI API, and Deepgram.
 - Added/rewrote AI/README.md and AI/API/README.md.
 - Added database README with schema/ERD and relationship explanations.

Please let me know if you have any questions.

Best,
Arthur

Hi all,

Please go over this and provide your "human feedback". We are requesting your expertise and not canned ChatGPT-based responses. Please follow Arthur's request for the format of the feedback.

Please [schedule a meeting with me](#) if you would like to discuss additional information.

Best regards,
Fadel

Hi Arthur,

The costs so far are minimal. Please feel free to use the GPT 5.6 Terra; I presume we will not have thousands of visitors so this should work well.

Please [schedule a meeting with me](#) if you would like to discuss additional information.

Best regards,

Fadel
